Artificial Intelligence for KarmaYogis

Artificial Intelligence (AI)
• AI means machines that can think and help like humans
• Example: mobile voice assistant, chatbots, etc.

Prompts
• A prompt is simply the question or instruction we give to AI
• Example: “Write an email” or “Explain this report”
Simple line he can say:
“Prompt matlab AI ko diya gaya instruction.”

Zero-shot, One-shot, Few-shot
• Zero-shot → Just ask directly (no example given)
→ “Write a leave application”

• One-shot → Give one example first
→ Show 1 sample, then ask AI

• Few-shot → Give 2–3 examples for better result

Simple line:
“Examples dene se AI aur sahi answer deta hai.”

Using ChatGPT
• It helps in:

- Writing emails
- Making reports
- Understanding data/graphs
- Saving time in office work

Simple line:
“ChatGPT office ka kaam fast aur easy bana deta hai.”

Generative AI (Gen AI)
• AI that can create new things:

- Text (like answers)
- Images
- Audio
- Videos

Simple line:
“Generative AI naya content bana sakta hai.”

Real-world Chatbots
• ASKDISHA 2.0 helps in train booking and queries
• DIGIDHAN Mitra helps with digital payment questions

Simple line:
“Chatbots logon ke sawalon ka turant jawab dete hain.”

Deepfakes
• Fake photos/videos made by AI
• Can look very real but are not true
• Sometimes used in scams

Simple line:
“Deepfake matlab AI se banaya gaya fake video ya photo.”

Data Privacy
• Never share personal information like Aadhaar, bank details, passwords
• AI tools are helpful but not fully private

Simple line:
“AI par personal data share nahi karna chahiye.”

Evolution of AI
• Earlier → Simple rule-based systems (limited work)
• Now → Smart AI (like ChatGPT)

- Understands language
- Gives human-like answers

Simple line:
"AI simple system se evolve hoke ab intelligent ho gaya hai."

Short Final Summary (he can speak this)
"AI ek technology hai jo machines ko human jaise kaam karne mein madad karti hai. ChatGPT jaise tools prompts ke through kaam karte hain aur emails, reports aur analysis mein help karte hain. Generative AI naya content bana sakta hai. Chatbots jaise ASKDISHA logon ki madad karte hain. Lekin deepfakes aur data privacy jaise risks bhi hain, isliye saavdhaani zaroori hai."

Artificial Intelligence in Finance

• AI is used in finance to analyze data and make predictions about markets
• It helps in detecting fraud, managing investments, and giving financial advice

---

Turing Test
• A test to check if a machine can behave like a human
• If a person cannot tell whether the response is from a human or AI, it passes the test

Simple line:
"AI agar human jaisa behave kare aur pehchaan na aaye, toh Turing Test pass karta hai."

Data for Prediction
• AI needs a large amount of data to make accurate predictions
• More and better data = better results

Simple line:
“Prediction ke liye data bahut important hota hai.”

Types of Learning in AI

• Supervised Learning
→ AI learns from labeled data (with correct answers)

• Unsupervised Learning
→ AI finds patterns on its own without labeled data

• Reinforcement Learning
→ AI learns by reward and punishment
→ Good result = reward, wrong result = penalty

Simple line:
“AI alag-alag tarike se seekhta hai jaise example se, khud se ya reward se.”

Regression and Classification

• Regression
→ Used to predict numbers
→ Example: predicting stock price

• Classification
→ Used to categorize data
→ Example: fraud or not fraud

Simple line:
“Regression numbers predict karta hai, classification categories batata hai.”

Robo Advisors
• AI-based systems that give financial or investment advice
• Helps users manage money automatically

Simple line:
“Robo advisor AI se financial advice deta hai.”

Low Code and No Code Tools

• Tools like n8n and NotebookLM
• These allow people to build applications with little or no coding

Simple line:
“Low code tools se bina zyada coding ke apps bana sakte hain.”

Data Used by Companies for Market Prediction

• Market Data
→ Prices, past performance, economic indicators

• Alternative Data
→ Social media trends, news, satellite data, web traffic

• Client Data
→ Customer behavior, goals, risk level

Simple line:
“Companies alag-alag type ka data use karke market predict karti hain.”

Short Final Summary (he can speak this)
“Finance mein AI ka use data analyse karke market predict karne ke liye hota hai. AI ko sahi prediction ke liye data chahiye aur yeh supervised, unsupervised aur reinforcement learning se seekhta hai. Regression aur classification jaise methods use hote hain. Robo advisors investment advice dete hain. Companies market data, social media trends aur customer data ka use karke better decisions leti hain.”

Fundamentals of Generative AI

Generative AI
• A type of AI that can create new content
• It can generate text, images, audio, and videos

Simple line:
“Generative AI naya content bana sakta hai.”

Transfer Learning
• A model is first trained on large data (base model)
• Then it is fine-tuned for a specific task

Simple line:
“Pehle AI ko general knowledge diya jata hai, phir usse specific kaam ke liye train kiya jata hai.”

Data – Compute – Algorithms
• These are the three main things required for AI

• Data → Information used to train AI
• Compute → Powerful machines to process data
• Algorithms → Rules and logic AI follows

Simple line:
“AI ke liye data, machine power aur logic teenon zaroori hote hain.”

Embeddings
• A way to convert text or data into numbers
• Helps AI understand meaning and relationships

Simple line:
“Embeddings data ko numbers mein convert karke AI ko samajhne mein help karte hain.”

Deepfakes
• AI-generated fake images or videos
• Can look real but may be misleading

Simple line:
“Deepfake AI se banaya gaya fake content hota hai.”

GPU (Graphics Processing Unit)
• A powerful chip used for AI processing
• Helps in handling large data and training AI models faster

Simple line:
“GPU powerful processor hai jo AI ko fast kaam karne mein help karta hai.”

Short Final Summary (he can speak this)
“Generative AI ek aisi technology hai jo naya content bana sakti hai. AI ko kaam karne ke liye data, compute aur algorithms ki zaroorat hoti hai. Transfer learning mein pehle model ko train karke phir specific kaam ke liye use kiya jata hai. Embeddings AI ko data samajhne mein help karte hain. GPU jaise powerful processors AI ko fast banate hain, lekin deepfakes jaise risks ka dhyaan rakhna zaroori hai.”

Common Compute Components

Term	Function
Graphics Processing Unit (GPU)	Specialized hardware → *Processing* → Large data
Tensor Processing Unit (TPU)	AI Optimized chips → *used by* → Google
Cloud Platforms	aws, Azure, Google Cloud - Where training runs

Summarize...

Key Part	What to Remember
Data	Learns from vast examples
Compute	Powerful machines make learning possible
Algorithms	Logic & models define how AI understands and creates
